

TruVision Outdoor IP Camera User Manual

P/N 1072587A-EN • REV 1.0 • ISS 27AUG12

Copyright	© 2012 UTC Fire & Security. All rights reserved.
Trademarks and patents	Interlogix, TruVision names and logos are trademarks of UTC Fire & Security. Other trade names used in this document may be trademarks or registered trademarks of the manufacturers or vendors of the respective products.
Manufacturer	UTC Fire & Security Americas Corporation, Inc. 2955 Red Hill Avenue, Costa Mesa, CA 92626-5923, USA Authorized EU manufacturing representative: UTC Fire & Security B.V. Kelvinstraat 7, 6003 DH Weert, The Netherlands
Certification	 N4131
FCC compliance	Class B: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. There is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: <ul style="list-style-type: none">• Reorient or relocate the receiving antenna.• Increase the separation between the equipment and receiver.• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.• Consult the dealer or an experienced radio/TV technician for help.
European Union directives	12004/108/EC (EMC directive): Hereby, UTC Fire & Security declares that this device is in compliance with the essential requirements and other relevant provisions of Directive 2004/108/EC.

Chapter 1

Introduction

Product overview

This is the user manual for TruVision Outdoor IP camera models:

- TVC-N225E-2M-N(-P) (IP bullet camera)
- TVC-M1245E-2M-N(-P) (1.3MPX WDR bullet camera)
- TVD-N225E-2M-N(-P) (IP dome camera)
- TVD-M1245E-2M-N(-P) (1.3MPX WDR dome camera)

Features

This section describes the camera features.

- Supports TCP/IP, HTTP, DHCP, DNS, DDNS, RTP/RTCP, PPPoE, SMTP, NTP protocols
- Programming and setup through a browser interface
- Live viewing over the network
- 50/60 Hz selectable flicker control
- 128dB Wide Dynamic Range (WDR models only)
- Motorized lens with zoom function
- Auto focus
- Supports remote upgrades and maintenance
- H.264 video compression with dual capability
- Supports HD (1.3MPX models), 4CIF, 2CIF, CIF and QCIF
- IP66 weather proof
- SDHC card for local storage (dome cameras only)
- Designed to ONVIF and PSIA open standards

Chapter 2

Installation

This chapter provides information on how to install the TruVision Outdoor IP dome and bullet cameras.

Installation environment

When installing your product, consider these factors:

- **Electrical:** Install electrical wiring carefully. It should be done by qualified service personnel. Always use a proper PoE switch or a 12 VDC UL listed Class 2 or CE certified power supply to power the the bullet camera, and a proper PoE / PoE+ switch or a 24 VAC UL listed Class 2 or CE certified power supply to power the dome camera. Do not overload the power cord or adapter.
- **Ventilation:** Ensure that the location planned for the installation of the camera is well ventilated.
- **Temperature:** Do not operate the camera beyond the specified temperature, humidity or power source ratings. The operating temperature of the bullet camera is between -10 to +60°C (14°F to 140°F) and outdoor dome is between -40 to +60 °C (-40 to +140 °F) with the heater and fan on. Humidity is below 90%.
- **Moisture:** Do not expose the camera to rain or moisture, or try to operate it in wet areas. Turn the power off immediately if the camera is wet and ask a qualified service person for servicing. Moisture can damage the camera and also create the danger of electric shock.
- **Servicing:** Do not attempt to service this camera yourself. Any attempt to dismantle or remove the covers from this product will invalidate the warranty and may also result in serious injury. Refer all servicing to qualified service personnel.
- **Cleaning:** Do not touch the sensor modules with fingers. If cleaning is necessary, use a clean cloth with a some ethanol and wipe the camera gently. If the camera will not be used for an extended period of time, put on the lens cap to protect the sensors from dirt.

Package contents

Check the package and contents for visible damage. If any components are damaged or missing, do not attempt to use the unit; contact the supplier immediately. If the unit is returned, it must be shipped back in its original packaging.

Package contents:

- Camera
- Hex wrench
- Video cable for testing (except bullet cameras)
- User manual
- Quick start guide
- CD with user manual and TruVision Device Finder.

CAUTION: Use direct plug-in UL listed power supplies marked Class 2/CE certified or LPS (limited power source) of the required output rating as listed on the unit.

Cable requirements

For proper operation, adhere to the following cable and power requirements for the cameras. Category 5 cabling or better is recommended. All network cabling must be installed according to applicable codes and regulations.

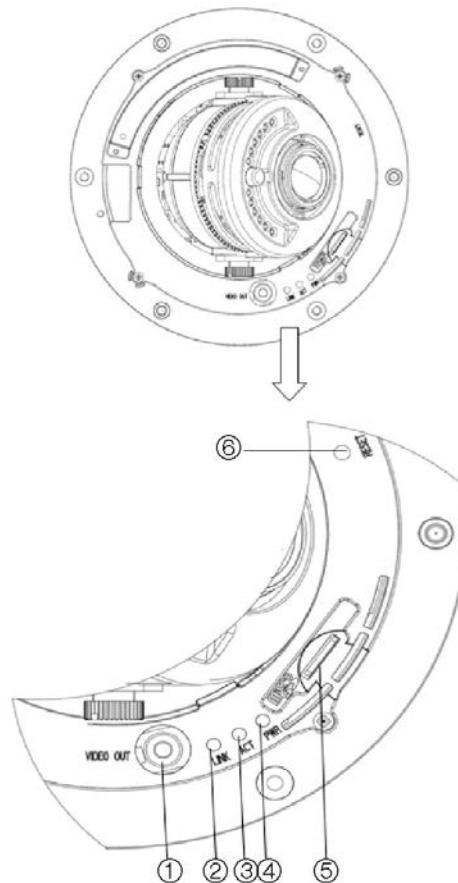

Table 1 below lists the requirements for the power cables that connect to the camera.

Table 1: Recommended power cable requirements

Bullet camera:	12 VDC power jack
Dome camera:	24 VAC power jack

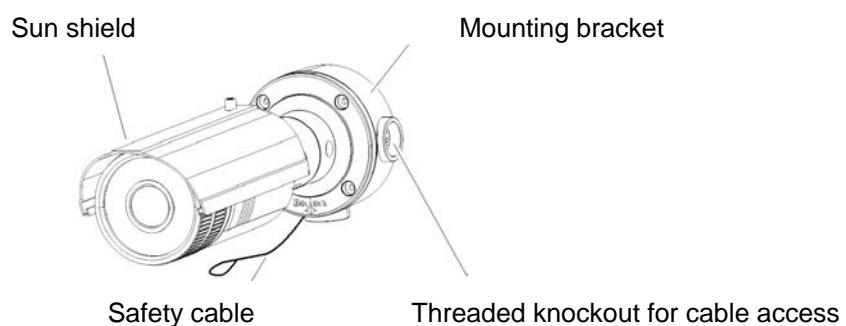

Camera descriptions

Figure 1: Outdoor IP dome camera

1. Video output interface
2. LINK LED: The yellow LED is lit when the network is connected.
3. ACT LED: The blue LED blinks when the network is correctly functioning.
4. PWR LED: The red LED is lit when the camera is powered up.
5. Micro SD slot
6. Reset switch.

Figure 2: Outdoor IP bullet camera

Setting up the camera

Note: If the light source where the camera is installed experiences rapid, wide-variations in lighting, the camera may not operate as intended.

To quickly put the dome camera into operation:

1. Prepare the mounting surface.
2. Connect the power and network cables to the camera. See “Connecting the devices” on page 6.
3. Mount the camera to the ceiling using the appropriate fasteners. See “Mounting the dome cameras on a ceiling” on page 8.
4. Set up the camera’s network and streaming parameters so that the camera can be controlled over the network. See “Chapter 3 Network and streaming configuration” on page 15.
5. Program the camera to suit its location. See “Chapter 4 Camera configuration” on page 25.

To quickly put the bullet camera into operation:

1. Prepare the mounting surface.
2. Connect the power and network cables to the camera. See “Connecting the devices” on page 6.
3. Mount the camera to the ceiling using the appropriate fasteners. See “Mounting the bullet camera” on page 8.
4. Set up the camera’s network and streaming parameters so that the camera can be controlled over the network. See “Chapter 3 Network and streaming configuration” on page 15.
5. Program the camera to suit its location. See “Chapter 4 Camera configuration” on page 25.

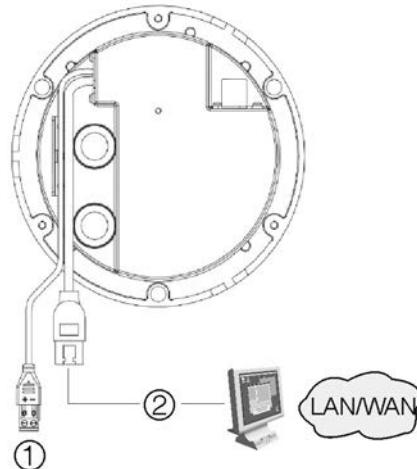

Connecting the devices

A qualified service person, complying with all applicable codes, should perform all required hardware installation.

Note: Do not attempt to extend the power/data cable connection using RJ45 couplers and Cat5 cable. Only use the data cable connection provided.

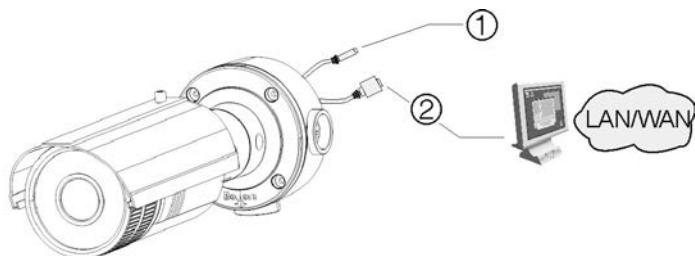

Note: Use 24 VAC or PoE/PoE+. The built-in heater requires the camera to be powered by 24 VAC or PoE+ in order to operate. When powered by standard PoE, the heater is disabled but the camera still functions normally.

Figure 3: Connections on the base of the dome cameras

1. Power supply
Connect +24 VAC power supply.
2. Ethernet RJ45 PoE port
Connect to network devices.

Figure 4: Connections of the bullet cameras

1. Power supply
Connect +12 VDC power supply.
2. Ethernet RJ45 PoE port
Connect to network devices.

Accessing the SDHC card

Insert an SDHC card up to 32GB for local storage as a backup in case the network fails, for example (see Figure 1 on page 5). The card is not supplied with the camera.

Video and log files stored on the SDHC card can only be accessed via the Web browser. You cannot access the card using TruVision Navigator or a recording device.

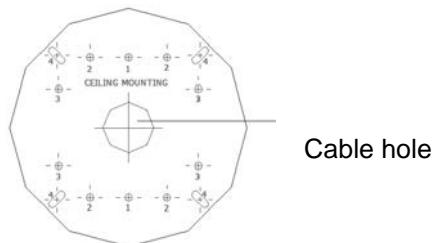

Note: There is no SDHC card slot in the bullet cameras.

Mounting the dome cameras on a ceiling

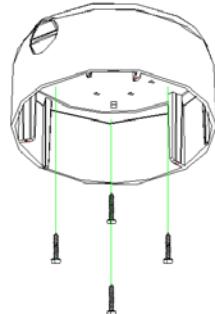

Mount the dome camera on a ceiling or wall.

To mount the dome on a ceiling:

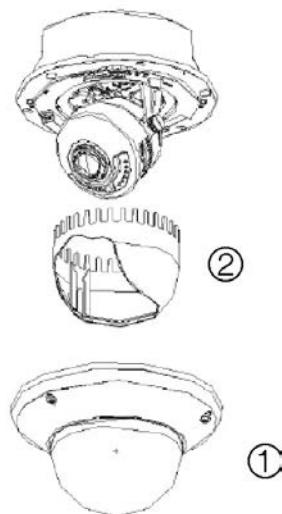

1. Use the supplied template to mark out the mounting area. Drill the screw holes on the ceiling. If you need to route the cables from the camera base, cut a cable hole in the ceiling.

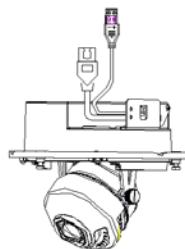

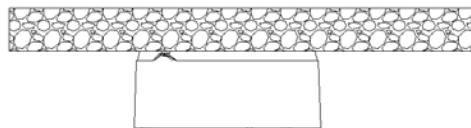

2. Secure the housing to the ceiling with screws.

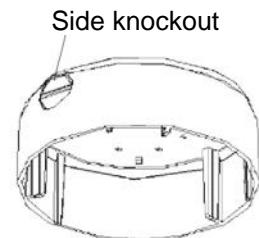

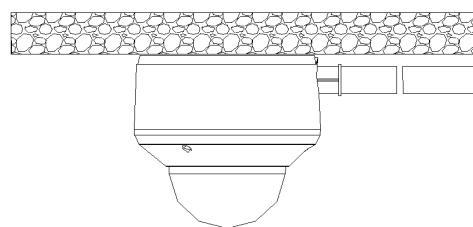

3. Loosen the screws on the dome enclosure (1) using the supplied hex wrench and remove the enclosure and the dome liner (2).

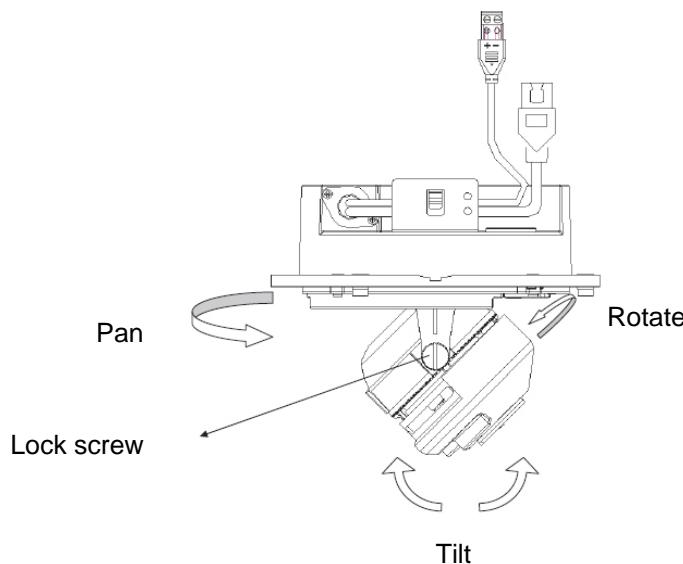

4. Insert the dome module into the housing and pull the camera's cables through the threaded knockout on the base of the housing.

Note: The cables can also be passed through the threaded side knockout of the housing. Use a waterproof conduit for the cables and seal all joints to ensure so that no moisture can leak into the mounting surface.

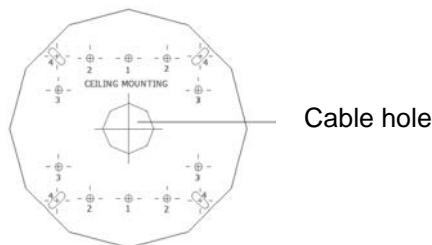

5. Connect the network and power cables.
6. While viewing the video on the monitor, adjust horizontally and vertically the camera pan and tilt. Adjust the lens focus to get optimal video effect.

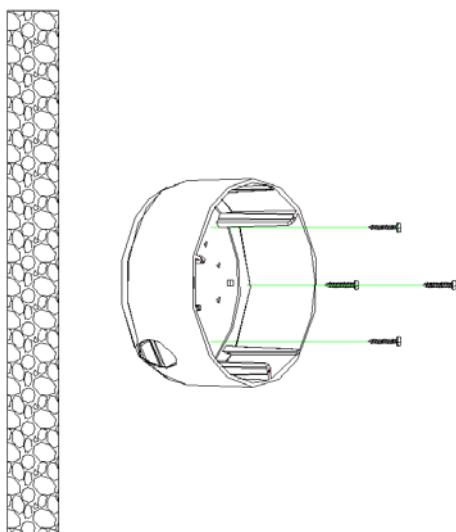

7. Reattach the dome liner and enclosure.

To mount the dome on a wall:

1. Use the supplied template to mark out the mounting area. Drill the screw holes on the wall. If you need to route the cables from the camera base, cut a cable hole in the wall.

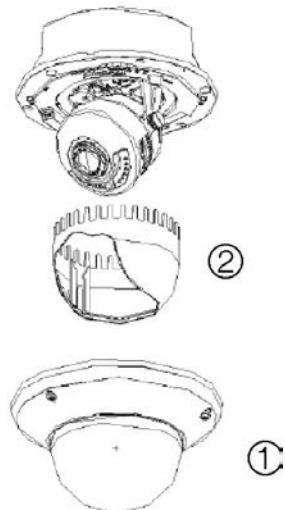

2. Secure the housing to the wall with screws.

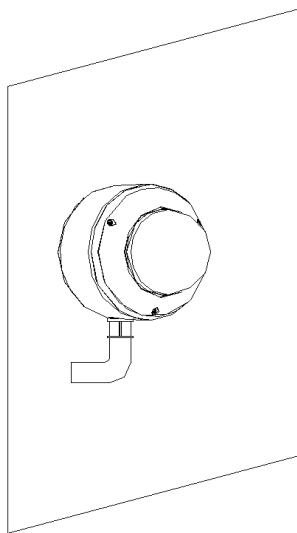

Note: Position the threaded side knockout facing downwards to prevent moisture from entering the camera.

3. Loosen the screws on the dome enclosure (1) using the supplied hex wrench and remove the enclosure and the dome liner (2).

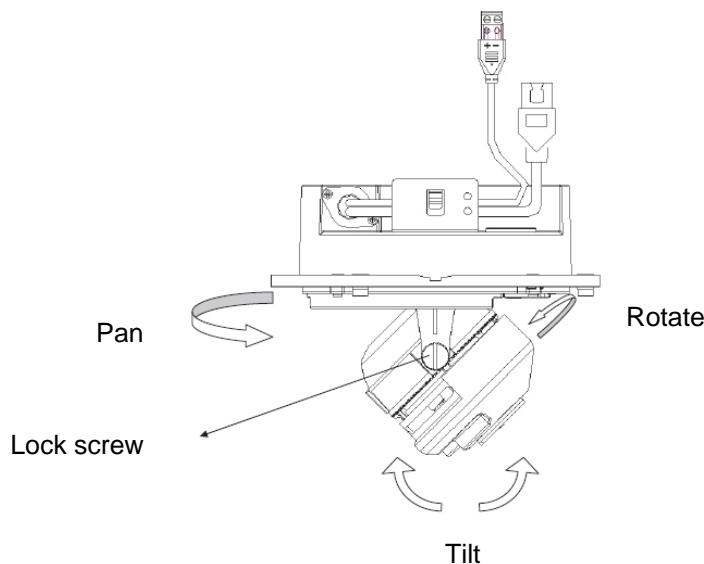

4. Insert the dome module into the housing and pull the camera's cables through the threaded knockout on the base of the housing.

Note: The cables can also be passed through the threaded side knockout of the housing. Use a waterproof conduit for the cables and seal all joints to ensure so that no moisture can leak into the mounting surface.

5. While viewing the video on the monitor, adjust horizontally and vertically the camera pan and tilt. Adjust the lens focus to get optimal video effect.

6. Reattach the dome liner and enclosure.

Mounting the bullet camera

Mount the bullet camera on a ceiling or wall.

To mount the camera on a ceiling:

1. Using the mounting bracket as a template, place it level against the mounting surface and mark the position of the mounting holes.
2. Following all local codes, drill and prepare the mounting holes.
3. Securely fasten the mount to the mounting surface with the appropriate fasteners. Clip the camera's safety cable to the building's superstructure for security.
4. If needed, seal all mounting holes so that no moisture can leak into the mounting surface.
5. Connect a 75 ohm coaxial video cable to the network cable, and connect a 12 VDC power supply to the power cable.
6. Adjust the camera position and angle as required.

Using the camera with TVR 60/ TVN 20/ TVN 40/ LNVR and other systems

Please refer to the head-end user manuals for instructions on connecting and operating the camera with these systems.

Using the camera with TruVision Navigator

A camera must be connected to a TVR 60/ TVN 20/ TVN 40 in order to be operated by TruVision Navigator. Please refer to the TruVision Navigator user manual for instructions on operating the camera with the TruVision Navigator.

Chapter 3

Network and streaming configuration

This chapter explains how to configure the camera network settings.

The cameras can be configured and controlled using an internet browser such as Microsoft Internet Explorer (IE). The procedures described use Microsoft Internet Explorer (IE) web browser. The steps are similar with other browsers.

You must have administrator rights on your PC in order to configure the cameras over the internet.

Checking your web browser security level

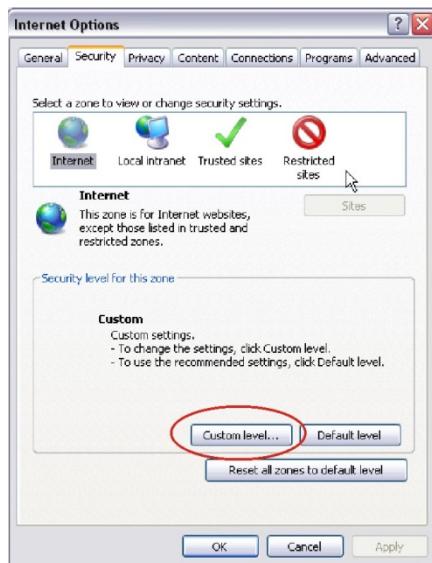

When using the web browser interface, you can install ActiveX controls to connect and view video using Internet Explorer. However, you cannot download data, such as video and images due to the increased security measure. Consequently you should check the security level of your PC so that you are able to interact with the cameras over the Web and, if necessary, modify the Active X settings.

Configuring IE ActiveX controls

You should confirm the ActiveX settings of your web browser.

To change the web browser's security level:

1. In Internet Explorer click **Internet Options** on the **Tools** menu.
2. On the **Security** tab, click the zone to which you want to assign a web site under “Select a web content zone to specify its security settings”.
3. Click **Custom Level**.

4. Change the **ActiveX controls and plug-ins** options that are signed or marked as safe to **Enable**. Change the **ActiveX controls and plug-ins** options that are unsigned to **Prompt** or **Disable**. Click **OK**.

- Or -

Under **Reset Custom Settings**, click the security level for the whole zone in the **Reset To** box, and select **Medium**. Click **Reset**.

Then click **OK** to the Internet Options Security tab screen.

5. Click **Apply** in the Internet Options Security tab screen.

Windows Vista and 7 users

Internet Explorer for Windows Vista and Windows 7 operating systems have increased security measures to protect your PC from any malicious software being installed.

To have complete functionality of the Web browser interface with Windows Vista and Windows 7, do the following:

- Run the Browser interface and the DVR player application as an administrator in your workstation
- Add the camera's IP address to your browser's list of trusted sites

To add the camera's IP address to Internet Explorer's list of trusted sites:

1. Open Internet Explorer.
2. Click **Tools**, and then **Internet Options**.
3. Click the **Security** tab, and then select the Trusted sites icon.
4. Click the **Sites** button.
5. Clear the "Require server verification (https:) for all sites in this zone box.
6. Enter the IP address in the "Add this website to the zone" field.
7. Click **Add**, and then click **Close**.
8. Click **OK** in the Internet Options dialog screen.
9. Connect to the camera for full browser functionality.

Accessing the camera over the internet

Use the web browser to access and configure the camera over the internet.

It is recommended that you change the administrator password once the set up is complete. Only authorized users should be able to modify camera settings. See "User management" on page 37 for further information.

To access the camera online:

1. In the web browser enter the camera's IP address (default is 192.168.1.70). Use the tool, *TruVision Device Finder*, enclosed on the CD to find the IP address of the camera.

The Login dialog box appears.

Note: Ensure that the Active X controls are enabled.

2. Enter your user name and password.

User name: admin

Password: 1234

3. Click **OK**. The Web browser window appears in live view mode.

Note: You can stop and start live view by clicking the Start/stop live view button  on the bottom of the window.

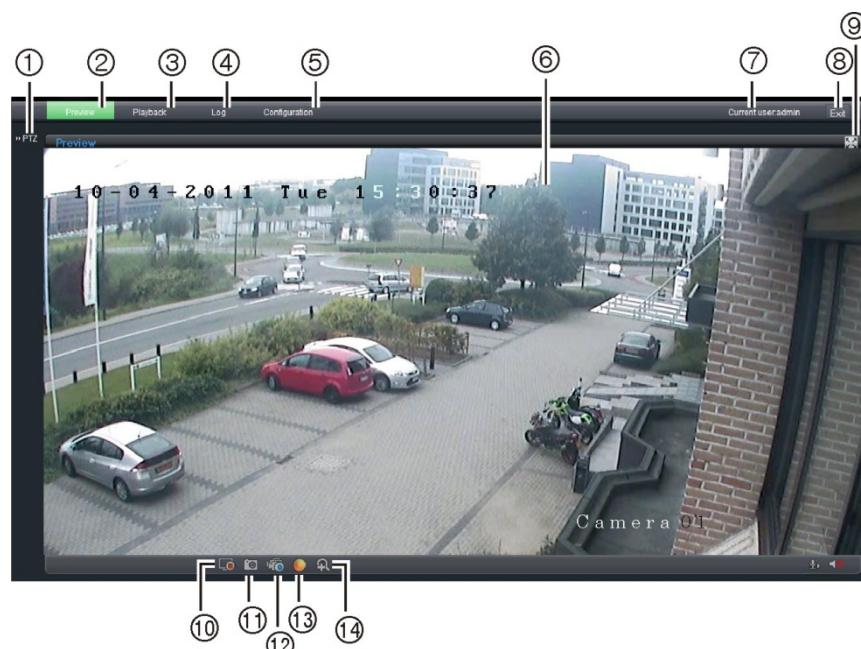

Overview of the camera web browser

The camera web browser lets you view, record, and play back recorded videos as well as manage the camera from any PC with Internet access. The browser's easy-to-use controls give you quick access to all camera functions. See Figure 5 below.

Only one camera is accessible from a single Web browser window. If there is more than one camera connected over the network, open a separate Web browser window for each individual camera.

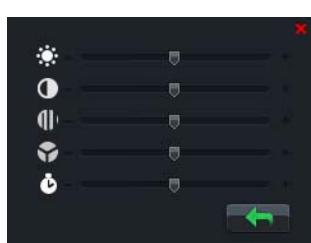

Note: Any changes made to the camera's configuration only apply to this camera. The configuration of other devices that may be connected to the camera, such as cameras or DVRs, is not changed.

Figure 5: Web browser interface

Item	Name	Description
1.	PTZ controls	For autofocus. Note: Only the zoom function is available for fixed IP cameras with motorized lens.

Item	Name	Description
2.	Live view	Click to view live video.
3.	Playback	Click to play back video.
4.	Log	Click to search for event logs. There are four main information types: All, Alarm, Notification and Operation
		Note: The Playback and Log functions are only available when an SDHC card is inserted in the camera.
5.	Configuration	Click to display the configuration window for setting up the camera. See Figure 6 on page 20.
6.	Viewer	Click to view live or play back video. Time, date and camera name are displayed here.
7.	Current user	Displays current user logged on.
8.	Exit	Click to log out from the system. This can be done at anytime.
9.	Full screen	Click to view as full screen. The top toolbar is not visible in full-screen mode.
10.	Start/stop live view	Click to start/stop live view.
11.	Capture	Click to take a snapshot of the video. The snapshot will be saved to the default folder in JPEG format. See “Local configuration” on page 20 for more information.
12.	Start/stop recording	Click to record live video.
13.	Video image settings	Click the required icon in the pop-up window and then slide the bar to adjust video image settings such as brightness, contrast, saturation, hue and exposure time (exposure time is equivalent to shutter speed). Changes appear immediately and are also applied to the settings in the menu “Camera image settings” (see page 34).
14.	e-PTZ	N/A

Click  to return to default settings.

Configuring the camera's network settings

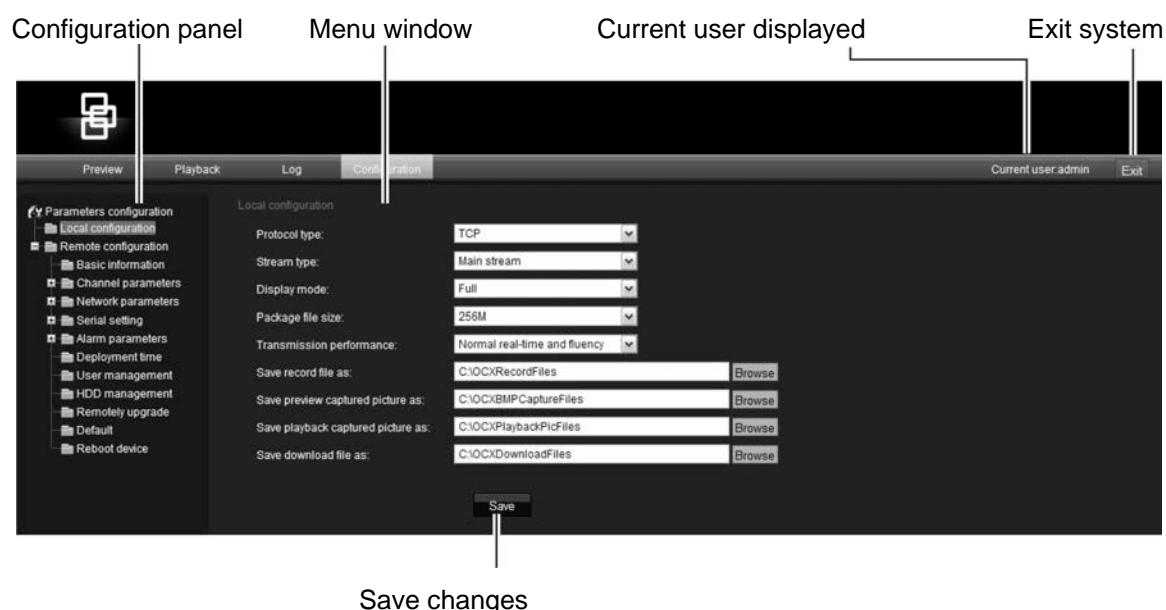

Once the camera hardware has been installed, configure the camera's network settings through the Web browser.

The camera Web browser lets you configure the camera remotely using your PC. The camera is configured using on-screen display (OSD) menus. In the Web browser window click the **Configuration** button on the toolbar to display the

configuration window. The Local configuration window appears. See Figure 6 on page 20.

The camera is shipped with on-screen display (OSD) menus in English only.

Figure 6: Example of a configuration window (Local configuration shown)

There are two main folders in the configuration panel:

- Local configuration
- Remote configuration

Local configuration

Use the Local menu to manage the network type, display mode and local storage paths. In the Configuration panel, click “Local configuration” to display the Local settings window. See Figure 6 and Table 2 for descriptions of the different menu parameters.

Table 2: Overview of the Local configuration window

Parameters	Description
Protocol type	Specifies the network protocol used. Options include: TCP and UDP.
Stream type	Specifies the streaming method used. Options include: Main stream and sub stream. Main is default.
Display mode	Specifies the width/height ratio of the image. Options include: Full screen, 4:3, 16:9 or adjustable.
Package file size	Specifies the maximum file size. Options include: 128 MB, 256 MB and 512 MB

Parameters	Description
Transmission performance	Specifies the transmission speed. Options include: Shortest delay mode, good real time, normal real time and fluency, and good fluency.
Save record file as	Specifies the directory for recorded files. The default directory is C:\Program Data\Web\RecordFiles.
Save captured picture as	Specifies the directory for saving snapshot files. The default directory is C:\Program Data\Web\BMPCaptureFiles.
Save playback captured picture as	Specifies the directory for saving playback files. The default directory is C:\Program Data\Web\PlaybackFiles.
Save download file as	Specifies the directory for downloaded files. The default directory is C:\Program Data\Web\DownloadFiles.

Remote configuration

Use the “Remote configuration” panel to remotely configure the server, network, camera, alarms, users, transactions and other parameters such as upgrading the firmware. See Figure 7 and Table 3 for descriptions of the configuration folders available.

Figure 7: Remote configuration panel (Basic information menu selected)

Table 3: Overview of the Remote configuration panel

Configuration folders	Description
Basic information	Defines the camera name and RS-485 bus ID. This window also displays the MAC address, device type, device SN and the current firmware version. See “Information about the camera” on page 22.
Channel parameters	Defines the OSD properties of camera information, recording parameters and schedules, motion detection parameters, image quality, alarm responses, and overlay text. See “Camera configuration” on page 25.

Configuration folders	Description
Network parameters	Defines the network parameters required to access the camera over the internet. See “Network parameters” on page 22.
Serial settings	N/A.
Deployment time	Defines the schedules during which events are registered. See “Events scheduling” on page 28.
User management	Defines who can use the camera, their passwords and access privileges. See “User management” on page 37on page 37.
HDD management	Defines how to format the SDHC card used in the camera. See “Formatting the SDHC card” on page 39.
Remote upgrade	Defines how to upgrade the camera’s firmware. See “Upgrading the firmware” on page 40.
Default	Restores default settings. See “Restoring default settings” on page 40.
Reboot device	Reboots the camera. See “Rebooting the camera” on page 41.

Information about the camera

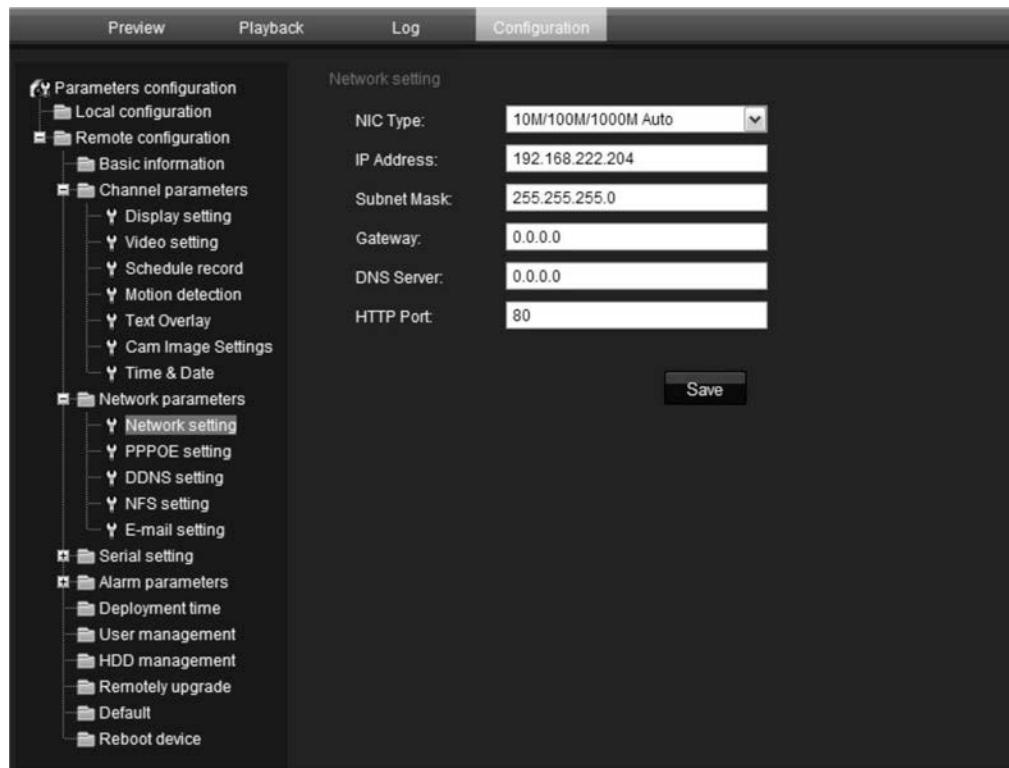

Use the “Basic information” menu to define the camera name and RS-485 bus ID. The default device name is “IP Camera” and device ID is 88. The camera can have up to 12 alphanumeric characters in its name.

Several parameters are also prepopulated and cannot be changed manually such as the camera, encoder, panel and hardware versions.

Network parameters

Accessing the camera through a network requires that you define certain network settings. Use the “Network Parameters” folder to define the network settings. See Figure 8 on page 23 for further information.

Note: When a network parameter is modified, the camera will prompt you to save and reboot.

Figure 8: Network subfolder window**Table 4: Network parameters**

Parameters	Description
Network	NIC type: Specifies the NIC type. Default is 10M/100M Auto. Other options include: 10M half-dup, 10M full-dup, 100M half-dup and 100M full-dup and 10M/100M auto. Default is 10M/100M. IP address: Specifies the IP address of the camera. Subnet mask: Specifies the subnet mask. Default value is 255.255.255.0. Gateway: Specifies the gateway IP address. Default value is 0.0.0.0. DNS server: Specifies the DNS server for your network. Default value is 0.0.0.0. HTTP port: Specifies the port used for the Internet Explorer (IE) browser. Default value is 80.
PPPoE	Use this option to retrieve a dynamic IP address.
DDNS	Specifies either DynDNS or IP server.
E-mail	Specifies the e-mail address to which messages are sent when an alarm occurs. It is not possible to send an attachment with the e-mail.

To define the network parameters:

1. In the “Network Parameters” folder click the **Network setting** subfolder to open its window.

From the NIC Type drop-down list, select the required value. Enter the values for the IP address, subnet mask, gateway, DNS server and HTTP port. Click **Save** to save changes.

2. Click the **PPPoE** setting subfolder to open its window and check **Enable PPPoE**. Enter the user name and password. Click **Save** to save changes.
3. Click the **DDNS** setting subfolder to open its window and check **Enable DDNS**. Enter either IP server or DynDNS as protocol.

If DynDNS is selected, enter the user name and password registered to the DynDNS web site. The domain name is that of the DynDNS web site. Click **Save** to save changes and return to the “Network settings” menu.

DDNS setting

Enable DDNS

Protocol Type:

Server Address:

Port:

User Name:

Password:

Domain Name:

4. Click the **E-mail** setting subfolder to open its window and enter the SMTP server, SMTP port, user name and password and the e-mail sender and receiver addresses. Click **Save** to save changes.

Chapter 4

Camera configuration

This chapter explains how to configure the cameras through a Web browser.

You must have administrator rights on your PC in order to configure the cameras over the internet.

Camera parameters

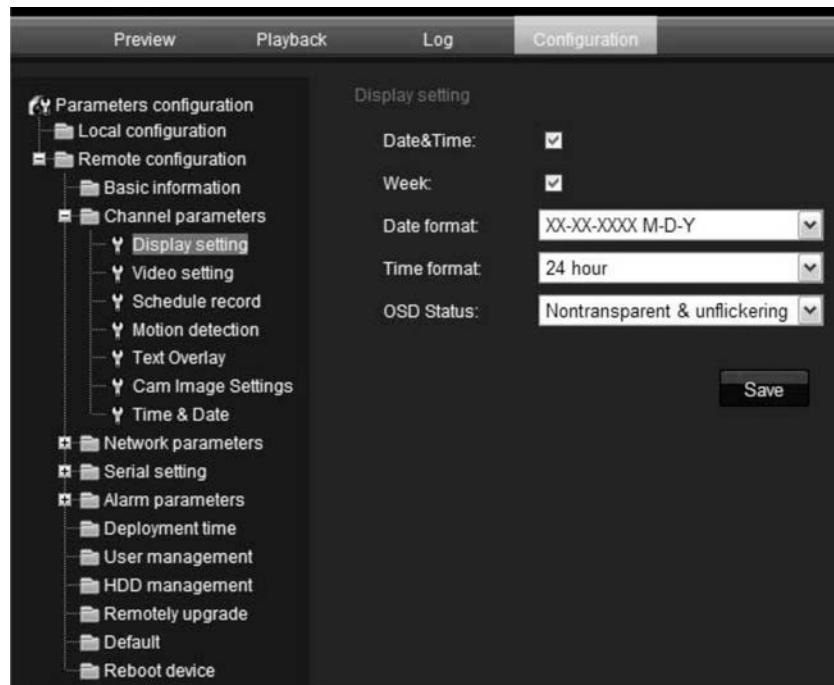

This section describes how to configure the camera settings from the Channel Parameters window. There are eight subfolders, which are described below:

- **Display settings:** Defines how the date and time are displayed. By default the name appears in the lower right corner of the window and the date/time on the top. See “Defining how information is displayed” on page 26 for information on defining the camera name.
- **Video settings:** Defines how the camera records an event. The stream mode, stream type, resolution, image quality, bit rate, frame rate, and video compression can all be modified. See “Defining the system time” on page 27 for more information.
- **Schedule record:** Defines the recording schedule of the camera. See “Defining a recording schedule” on page 30.
- **Motion detection:** Defines the on-screen area to trigger a response and the method of response. See “Motion detection alarm” on page 31.
- **Text overlay:** Defines up to four lines of extra text on-screen. They can be positioned anywhere. See “Adding extra on-screen text” on page 34.
- **Camera image settings:** Defines image quality parameters as well as camera behavior such as shutter speed, iris mode, day/night mode, IR mode, image flip, power mode and white balance.
- **Time & date:** Defines the synchronization of the time and date with the NTP server.

All changes made apply only to the camera being configured. Parameters cannot be copied to another camera.

Note: When schedule parameters are modified, the camera will prompt you to reboot after the changes are saved.

Figure 9: Channel parameters folder (Display setting menu shown)

Defining how information is displayed

In addition to the camera name, the camera also displays the system date and time on screen. You can also define how the text appears on screen.

To position the date/time on screen:

1. In the Channel Parameters folder click the **Display Setting** subfolder to open its window.
2. Check the **Date&Time** box to display the date/time on screen.
3. Check the **Week** box to include the day of the week in the on-screen display.
4. Select the date format from the **Date format** list box. Formats include:
 - YYYY-MM-DD
 - MM-DD-YYYY (Default)
 - DD-MM-YYYY
5. Select the time format from the **Time format** list box. Formats include: 24-hour and 12-hour.

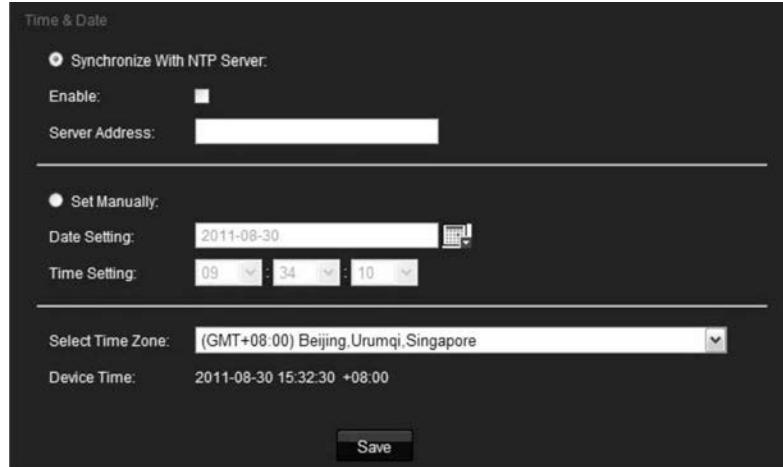

6. Select a display mode for the camera from the **OSD Status** list box. Display modes include:
 - **Transparent & non-flashing.** The image appears through the text. This is default.
 - **Transparent & flashing.** The image appears through the text. The text flashes on and off.
 - **Non-Transparent & unflickering.** The image is behind the text.
 - **Non-Transparent & flashing.** The image is behind the text. The text flashes on and off.
7. Click **Save** to save changes.

Defining the system time

NTP (Network Time Protocol) is a protocol for synchronizing the clocks of network devices, such as IP cameras and computers. Connecting network devices to a dedicated NTP time server ensures that they are all synchronized.

To define the system time and date:

1. In the “Channel Parameters” folder click the **Time & Date** subfolder to open its window.

2. Check one of the options for setting the time and date:

Synchronize with an NTP server: Check the enable box and enter the server NTP address.

- Or -

Set manually: Enter the current date and time values.

3. Select your time zone.
4. Click **Save** to save changes.

Alarm parameters

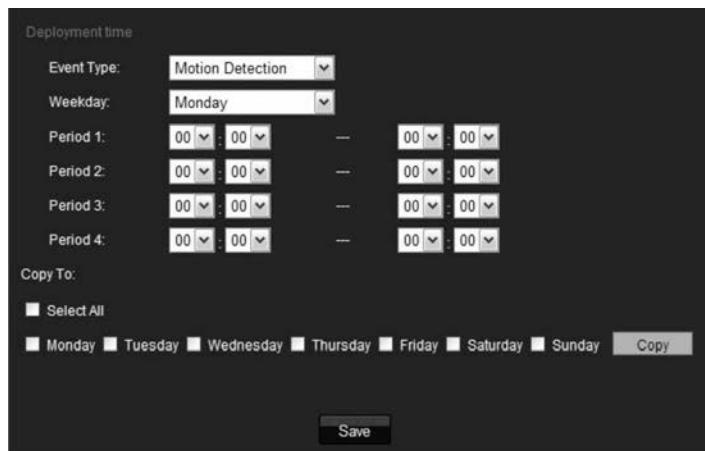

For future use.

Events scheduling

Use the deployment time menu to schedule when events can be registered. Outside of these scheduled periods, the system cannot register any events. You can configure up to four event periods a day.

For the event schedule to be operational, you must also define the motion detection parameters (see page 31) as well as the alarm input and output parameters (see page 28.) The recording schedule for motion detection must fall within the time period of the event schedule.

Figure 10: Deployment time menu

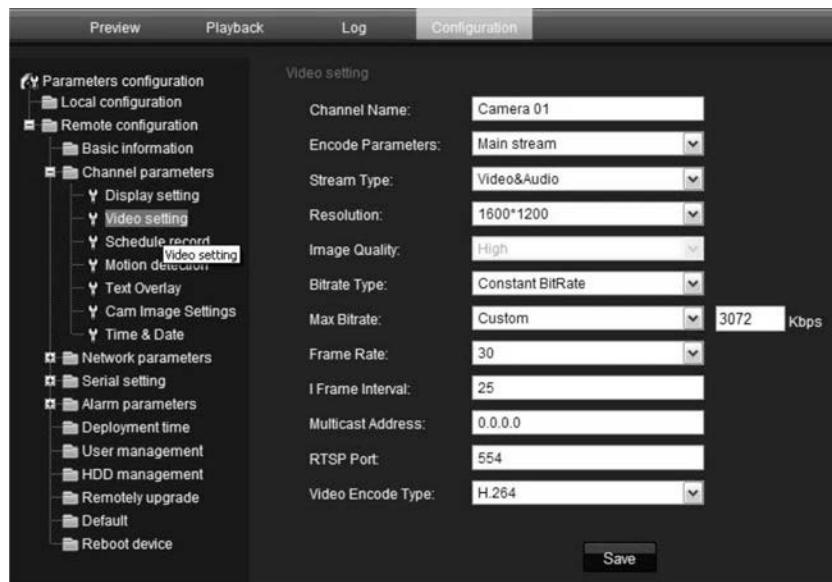

To define an event schedule:

1. Click the “Deployment” folder to open its window.
2. Under “Event type” select the option to be scheduled from the dropdown list. There are five options: Motion detection, input port 1, input port 2, output port 2 and output port 2.
3. Select the day of the week and the time period for the event schedule. The time periods must not overlap.
4. Select another day of the week to set up its event schedule.
- Or -
Copy the event schedule to other days of the week by checking the days required and click **Copy**.
5. Click **Save** to save changes.

Defining recording parameters

You can adjust the video recording parameters to obtain the picture quality and file size best suited to your needs. Figure 11 below lists the recording options you can configure for the camera.

Figure 11: Video setting menu

Parameter	Description
Channel name	Name of the camera
Encoding parameters	Specifies the dual streaming method used. Options include: Main stream and sub stream. Default is Main.
Stream type	Specifies the stream type you wish to record. Select Video to record video stream only. Select Video&Audio to record both video and audio streams. Default value is Video&Audio.
Resolution	Specifies the recording resolution. A higher image resolution provides a higher image quality but also requires a higher bit rate. The resolution options listed depend on the type of camera and on whether main or sub stream is being used. If you make changes to this option, you must reboot the camera to implement the changes. The options are: Main stream: 352*240, 352 *288, 640*480, 704*480, 704*576, 800*600, 1280*720, 1280*960. Sub stream: 176*144, 320*240 and 352*240 Note: Resolutions can vary depending on the camera model.
Image quality	Specifies the quality level of the image. Value is prepopulated High. It cannot be changed.
Bit rate type	Specifies whether variable or fixed bit rate is used. Variable produces higher quality results suitable for video downloads and streaming. Default is Variable.

Parameter	Description
Max bit rate	Specifies the maximum allowed bit rate. A high image resolution requires that a high bit rate must also be selected. Options include: 32 bps, 48, 64, 80, 96, 128, 160, 192, 224, 256, 320, 384, 448, 512, 640, 768, 896, 1024, 1536, 1792, 2048, Custom (enter a value manually) Default is 2048.
Frame rate	Specifies the frame rate for the selected resolution. The frame rate is the number of video frames that are shown or sent per second. Default value is 25 (PAL)/ 30 (NTSC).
I frame interval	A video compression method. It is strongly recommended not to change the default value displayed: 25.
Multicast address	Specifies a D-class IP address between 224.0.0.0 to 239.255.255.255. You do not need to specify this option if you are not using the multicast function. Some routers prohibit the use of multicast function in case of a network storm. The default value is 0.0.0.0.
RTSP port	Specifies the RTSP port. The default value is 554.
Video encoder type	Specifies the video encoder used. Options include: H.2.64 and MPEG4

Defining a recording schedule

You can define a recording schedule for the camera in the “Schedule record” window. The recording is saved on to the SDHC card in the camera. Although all recordings are saved on a DVR, the camera’s SDHC card provides a backup in case of network failure, for example.

The selected recording schedule applies to all alarm types.

You will be prompted to reboot the camera after making any schedule modifications.

Post-event recording times

The post-event record time is used if you have the motion detection enabled. When a motion alarm is cleared, the camera will continue recording based on the value specified in this option. Options include: 5 (default), 10, 30 seconds, 1, 2, 5, and 10 minutes.

To define a recording schedule:

1. In the “Channel parameters” folder click the **Schedule record** subfolder to open its window.
2. Click the **Enable Recording** box to enable recording.
Note: To disable recording, deselect the option.
3. Select the post record time from the drop-down list.
4. Select whether the recording will be for the whole week (All day recording) or for specific days of the week (Section recording).

If you have selected “All day recording”, select one of the record types to record from the drop-down list box:

- Schedule recording. This is continuous recording.
- Motion detection

5. If you selected “Section recording”, click the day of the week required and then for section (period) 1 set the start and end times during which you want the camera to begin and end recording.

From the drop-down list box select one of the record types to record.

Repeat for additional periods in the day. Up to four time periods can be selected.

Note: The four time periods cannot overlap.

6. Set the recording periods for the other days of the week if required.

Use the **Copy to** option to copy the recording periods to another day of the week.

7. Click **Save** to save changes.

Notes

- The camera will prompt you to reboot in order for the schedule to take effect.
- If you set the record type to “Motion detection”, you must also define the motion detection alarm in order to trigger motion recording. See “Motion detection alarms” below for more information.

Motion detection alarms

You can define motion detection alarms. A motion detection alarm refers to an alarm triggered when the camera detects motion. However, the motion alarm is only triggered if it occurs during a programmed time schedule.

Select the level of sensitivity to motion as well as the target size so that only objects that could be of interest can trigger a motion recording. For example, the motion recording is triggered by the movement of a person but not that of a cat.

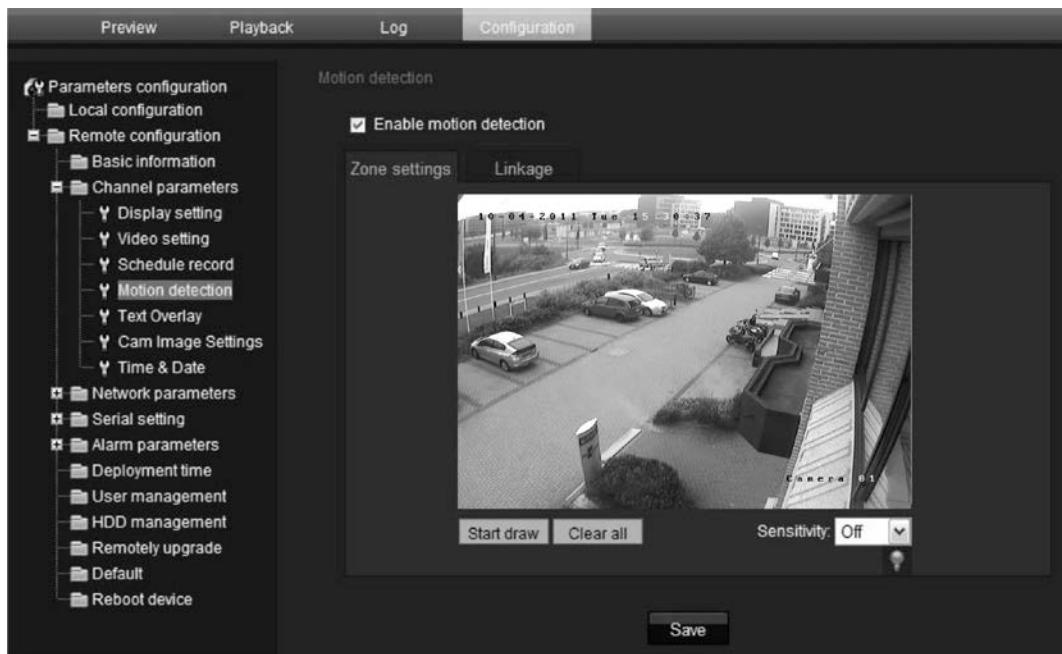

You can define the area on screen where the motion is detected, the level of sensitivity to motion, the schedule when the camera is sensitive to detecting

motion as well as which methods are used to alert you to a motion detection alarm.

Use the “Motion detection” window in the “Channel parameters” folder to change the motion detection settings.

The recording schedule of the motion detection must fall within the time period of the event schedule in order to operate correctly. See “Events scheduling” on page 28 for more information.

Figure 12: Motion detection menu

Defining a motion detection alarm requires the following tasks:

1. **Events schedule:** Define the schedule during which the system inputs and outputs are operational to detect alarms. See “Events scheduling” on page 28.
2. **Recording schedule:** Define the schedule during which motion detection can be recorded. See “Defining a recording schedule” (see page 30).
3. **Settings areas:** Define the on-screen area that can trigger a motion detection alarm and the detection sensitivity level. See below.
4. **Linkage:** Specify the method of response to the alarm. See below.

To define the motion detection areas and response method:

Note: The deployment and motion detection recording schedules must also be defined for motion to be detected and recorded. See “Events scheduling” on page 28 and “Defining a recording schedule” on page 30.

1. In the Channel Parameters folder click the **Motion detection** subfolder to open its window.

2. Check the **Enable Motion Detection** box.

Note: Deselect the “Enable Motion Detection” option to disable the motion detection alarm.

3. Define the motion detection area or areas.

Click the **Zone settings** tab to display the motion detection window.

Place your mouse pointer at a point on the window from where you want to start marking the motion detection area and it to mark the area sensitive to motion. Several areas can be defined.

Note: You cannot adjust an area already drawn. Click **Clear All** to delete all areas marked and restart drawing.

4. Select the motion detection sensitivity level from the drop-down list.

All areas will have the same sensitivity level.

5. Click the **Linkage** tab. The **Linkage** window appears.

6. Check one or more response methods for the system when a motion detection alarm is triggered.

Audible warning	Triggers an audible <i>beep</i> when a notification or alarm is detected.
Notify surveillance center	Sends a signal to TruVision Navigator or other software applications when an alarm or notification is detected
Send Email	Sends an e-mail to a specified address when there is a motion detection alarm. See “Network parameters” on page 22 for further information.
Upload to FTP	Upload a video image snapshot to a user-defined FTP server.
Trigger channel	Triggers the recording to start in the camera (A1).

7. Click **Save** to save changes.

Adding extra on-screen text

You can add up to four lines of text on screen. This option can be used, for example, to display emergency contact details. Each text line can be positioned anywhere on screen.

To add on-screen text:

1. In the Channel Parameters folder click the **Text Overlay** subfolder to open its window.
2. Check the **OSD text** box for the first line of text.
3. Enter the text in the **Text information** column. Up to 22 alphanumeric characters can be used.
4. Enter the X and Y position co-ordinates of the text line on screen. The position values can be between 1 and 512.
5. Repeat steps 2 and 4 for each extra line of text, selecting the next string number.
6. Click **Save** to save changes.

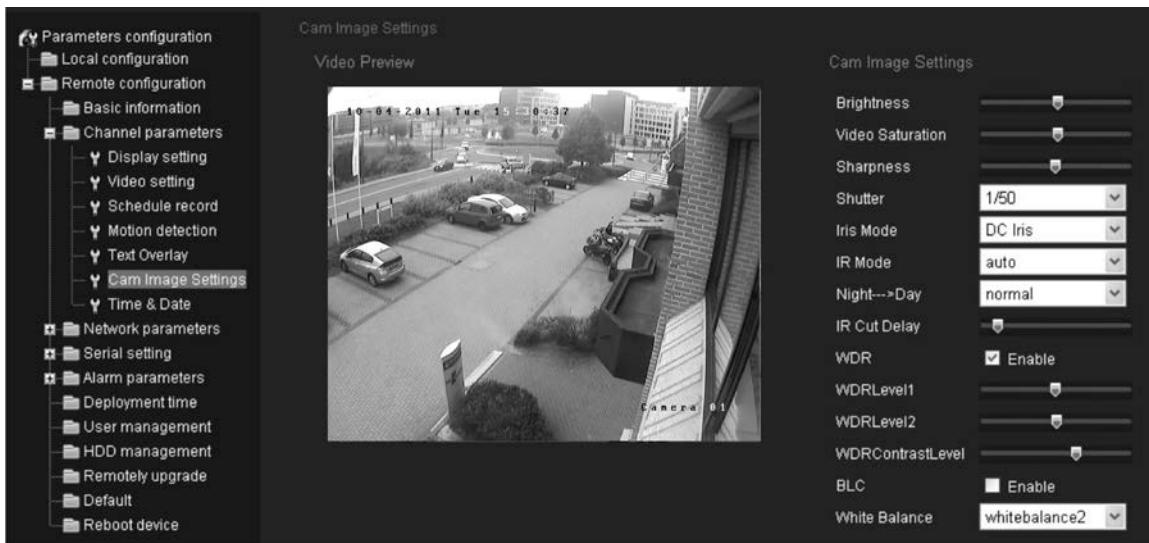

Configuring the video image

You may need to adjust the camera image depending on the camera model or location background in order to get the best image quality. You can adjust the brightness, contrast, saturation and sharpness of the video image. See Figure 14 below.

Brightness, contrast, saturation, hue and shutter speed can also be modified in live view using the pop-up video image menu. See item 13 in Figure 13 on page 35 for more information.

Use this menu to also adjust camera behavior parameters such as shutter speed, iris mode, day/night mode, IR mode, image flip, power mode and white balance.

Figure 13: Camera image settings menu (4CIF camera shown)

Parameter	Description
Brightness	Modifies the different elements of picture quality by adjusting the position of the values for each of parameter.
Video saturation	
Sharpness	
Shutter	The shutter speed controls the length of time that the aperture is open to let light into the camera through the lens. Select a higher value to see movement and a lower value to see clearer images. The settings available depend on the lens type used.
Iris mode	There are two settings, Manual and DC Iris. The type of lens determines which setting is used.
Power mode	The camera cannot auto-sense the power supply. Select 50 Hz (PAL) or 60 Hz (NTSC) depending on your region.
IR mode	Defines whether the camera is in day or night mode. The day (color) option could be used, for example, if the camera is located indoors where light levels are always good. Options: Day: Camera is always in day mode. Night: Camera is always in night mode. Auto: The camera automatically detects which mode to use. Default is Auto.
Day/Night	Adjusts the sensitivity of the camera to color or black and white. Options: Low, Normal or High. Default is Normal.
IR cut delay	Adjusts the delay time to change between day and night mode.

Parameter	Description
WDR level 1	<i>1.3MPX only</i> When enabled, this feature (wide dynamic range) allows you to see details of objects in shadows or details of objects in bright areas of frames that have high contrast between light and dark areas.
WDR level 2	N/A
WDR contrast level	N/A
BLC	N/A
Image flip	Use this function to flip the original image into a mirror image. This could be used, for example, when the camera needs to be installed upside down. The image can be flipped horizontally (up/down), vertically (right/left) or centered. Default is None. Note: The on-screen text does not flip.
White balance	White balance (WB) tells the camera what the color white looks like. Based on this information, the camera will then continue to display all colors correctly even when the color temperature of the scene changes such as from daylight to fluorescent lighting, for example. Select one of the options: Auto: White balance is determined automatically. White balance 1: White balance for indoor environments. White balance 2: White balance for outdoor environments. This option is only available on 4CIF camera models.

Chapter 5

Camera management

This chapter describes how to use the camera once it is installed and configured. The camera is accessed through a Web browser.

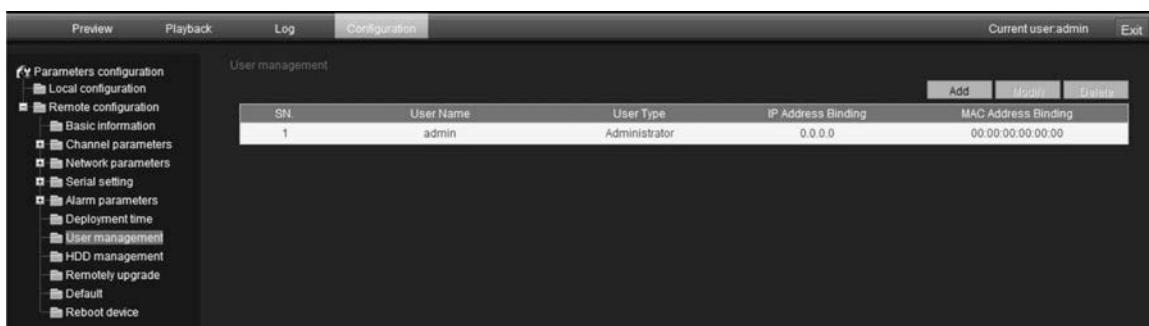

User management

This section describes how to manage users from the “User Management” window. You can:

- Add or delete users
- Modify passwords

Only the administrator can manage users. The administrator can create up to 15 additional individual users. When new users are added to the list, the administrator can define individual passwords or each user can use a default password. See Figure 14 below.

Figure 14: User management window

Passwords limit access to the camera and the same password can be used by several users. When creating a new user, you must give the user a password. There is no default password provided for all users. Users can modify their password. However, only the administrator can create a password for a user. Admin passwords can have up to four digits, ranging from 1 to 4.

Note: Keep the admin password in a safe place. If you should forget it, contact technical support.

You can control who can connect to a camera by the user IP and physical (MAC) addresses entered for a user. Setting up a user with a MAC address from the user's computer prohibits access to the camera from other computers. All users can connect to a camera when IP and MAC addresses are set to zero.

The user access rights must be set up for each camera individually.

Types of users

A user's access privileges to the system are automatically defined by their user type. There are three types of user:

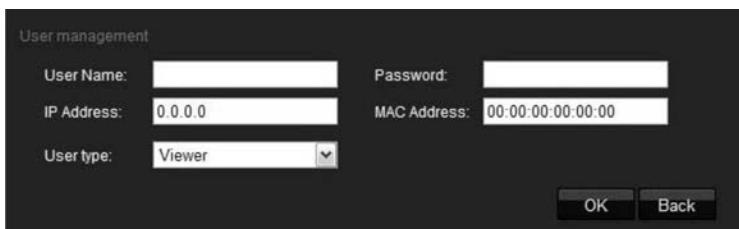

- **Admin:** This is the system administrator. The administrator can configure all settings. Only the administrator can create and delete user accounts. Admin cannot be deleted.
- **Operator:** This user can only change the configuration of his/her own account. An operator cannot create or delete other users.
- **Viewer:** This user can use the live view, record and playback modes as well as take snapshots. However, they cannot change any configuration settings nor search the logs for events.

Adding and deleting users

The administrator can create up to 15 users. Only the system administrator can create or delete users.

To add a user:

1. Click the **User management** folder to open its window.
2. Select the **Add** button. The user management window appears.

Note: Only the administrator can create a user.

3. Enter a user name. The name can have up to 16 alphanumeric characters.
4. Assign the user a password. Passwords can have up to 16 alphanumeric characters.
5. Enter the IP address and physical address (MAC address) of the user's computer.
6. Select the type of user from the drop-down list. The options are Viewer and Operator.
7. Click **OK** to save the changes and return to the main "User management" window.

To delete a user:

1. Click the **User management** folder to open its window.
2. Select the **Delete** button. The user management window appears.

Note: Only the administrator can delete a user.

3. Click the desired user in the list. Select **Delete**.
Confirm that you want to delete the user.
4. Click **OK** to save the changes.

Modifying user information

You can easily change the information about a user such as their name, password or computer ID.

To modify user information:

1. Click the **User management** folder to open its window.
2. Select the user.
3. Click the **Modify** button. The user management window appears.
4. Change the information required.

Note: The user “Admin” can only be changed by entering the admin password.

5. Click **OK** to save the changes.

Formatting the SDHC card

Use the HDD Configuration window to display the capacity and free space available on the SDHC card in the camera as well as the working status of the HDD. You can also format the card.

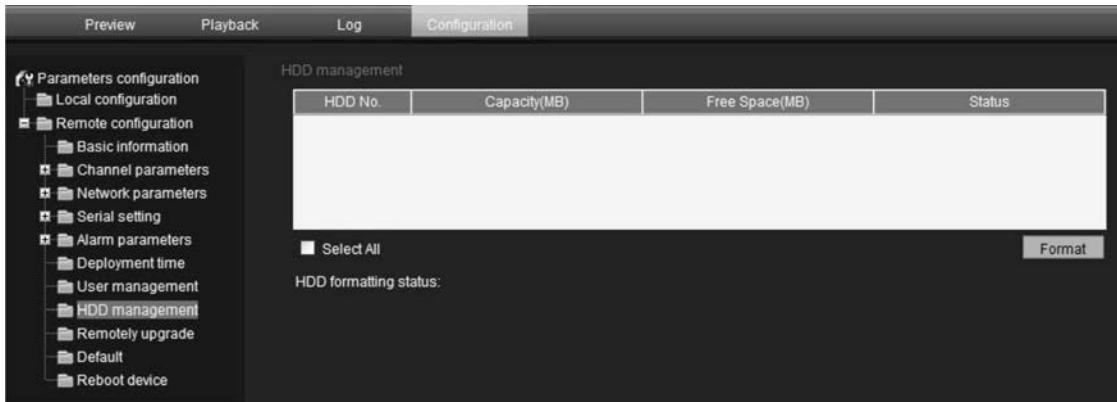

Note: This function is not available for bullet cameras.

Before formatting the HDD (the SDHC card) stop all recording. Once formatting is completed, reboot the camera as otherwise the device will not function properly.

When the card becomes full, it overwrites the oldest recordings.

To format the SDHC card:

1. Click the **HDD Management** folder to open its window.

2. Click **Select All** in the HDD Number column to select the SDHC card. Only one HDD option is listed.
3. Click **Format**. A window appears showing the formatting status.

Restoring default settings

Use the Default menu to restore default settings to the camera. There are two options available:

- **Full mode:** All parameters are restored to factory default settings.
- **Basic mode:** All parameters are restored to factory default settings except for the network settings IP address, subnet mask gate and port.

You can also do a hard reset by pressing the INITIAL SET button on the base of the camera (see Figure 3 on page 7).

To restore default settings:

1. Click the **Default** folder to open its window.
2. Click either **Full mode** or **Basic mode**. You will receive a prompt asking you to reboot the camera.

Upgrading the firmware

The camera firmware is stored in the flash memory. Use the upgrade function to write the firmware file (*digicap.DAV*) into the flash memory.

You need to upgrade firmware when it has become outdated. When you upgrade the firmware, all existing settings are unchanged. Only the new features are added with their default settings.

To upgrade the firmware through the Web browser:

1. Download on to your computer the latest firmware from our web site at:
www.utcfsssecurityproductspages.eu/videoupgrades/
2. In the “Remote configuration” folder select the subfolder “Remotely upgrade” to open the “Remotely upgrade” window.
3. Click the **Browse** button to locate the latest *digicap.DAV* file on your computer.
4. Click **Update**. You will receive a prompt asking you to reboot the camera.

Rebooting the camera

The camera can be easily rebooted remotely.

Click the folder **Reboot device** to open its window. Click **OK** to the question “Restart the device?” The camera reboots.

Chapter 6

Camera operation

This chapter describes how to use the camera once it is installed and configured.

Logging on and off

You can easily login and out of the camera browser window by clicking the Login button on the menu toolbar. You will be asked each time to enter your user name and password when logging in.

Figure 15: Login dialog box

Only one camera is accessible from a Web browser window. If there is more than one camera connected to the network, open a separate Web browser window for each individual camera.

Live view mode

Once logged in, open the camera's Web browser window and click "Live" on the menu toolbar to access live view mode. See "Figure 5: Web browser interface" on page 18 for the description of the interface.

You can stop and start live view by clicking the Start/stop live view button  on the bottom of the screen.

Adjusting the image quality

Click the image quality button in the live view window to get a pop-up window that lets you adjust video image settings such as brightness, contrast, saturation, hue and exposure time (see Figure 5 on page 18). Changes appear immediately and are also applied to the settings in the menu “Camera image settings” (see page 34).

Manual recording

You can manually record live video and store the images on your computer’s desk top. In the live view window, click the Record button at the bottom of the screen. To stop recording, click the button again.

A folder with the recording automatically opens on your computer desktop when recording stops.

Note: You must have manual recording rights to manually record images. See “Modifying user information” on page 39 for more information.

Taking a snapshot

You can take a snapshot of a scene when in live view. Simply click the snapshot button located at the bottom of the screen to save an image. The image is in jpeg format. Snapshots are saved on the hard drive.

Playing back recorded video

You can easily search and play back recorded video from the dome cameras.

Note: There must be an SDHC card inserted in the camera to be able to use the playback functions. Playback is not available for the bullet cameras as they cannot be used with an SDHC card.

To search recorded video stored on the camera’s SDHC card for playback, click **Playback** on the menu toolbar. The Playback window displays. See Figure 16 on page 45.

Figure 16: Playback window

Item	Name	Description
1.	Playback button	Click to open the Playback window.
2.	Full screen	Click to view as full screen.
3.	Current status	Displays recording type currently being played.
4.	Search calendar	Click the day required to search. You cannot search by particular criteria such as alarm type or time. However, the type of recording is displayed in the recording type bar (see item 9). The color codes of the recording types are shown in item 11.
5.	Locate time	Click to enter a specific time period to search.
6.	Start search	Start search. Results are listed in the file list box underneath and are arranged by start time.
7.	Download	Click to download the selected file to your computer desktop.
8.	Control playback	Click to control how the selected file is played back: play, stop, reverse and fast forward playback.
9.	Timeline bar	The timeline bar displays the 24-hour period of the day being played back. It moves left (oldest) to right (newest). The bar is color-coded to display the type of recording. Click a location on the timeline to move the cursor to where you want playback to start. The timeline can also be scrolled to earlier or later periods for playback.
10.	Time moment	Vertical bar shows where you are in the playback recording. The current time and date are also displayed.

Item	Name	Description
11.	Recording type	<p>The color code displays the recording type. Recording types are schedule recording, alarm recording and manual recording.</p> <p>The recording type name is also displayed in the current status window.</p>
12.	Archive functions	<p>Click these buttons for the following archive actions:</p> <p> Capture a snapshot image of the playback video.</p> <p> Save the selected file onto your desktop.</p>
13.	Audio	<p> Adjust the audio level.</p>

To play back a recorded file

Note: You must have playback rights to playback recorded images. See “Modifying user information” on page 39 for more information.

1. Search for the desired video files using the Playback window. Recordings can be searched by date and time. They are listed in the file list box and are arranged by start time.
2. Double-click a video file in the file list box to start playback. Only the selected file is played.

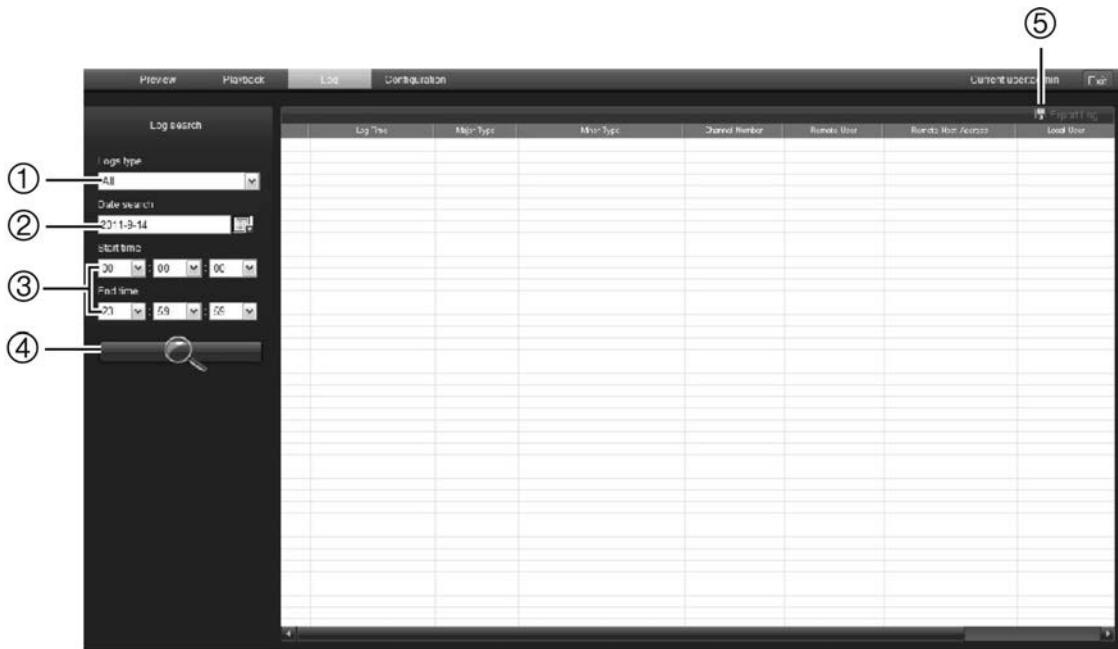

While playing back a video, the timeline bar displays the type and time of the recording. The timeline can be manually scrolled using the mouse.

Searching event logs

There must be an SD card inserted in the camera to be able to record logs. The log function is not available for the bullet cameras as they cannot be used with an SD card.

The number of event logs that can be stored on a SD card depends on the capacity of the card. When this capacity is reached, the system starts deleting older logs. To view logs stored on the camera’s SD card, click **Log** on the menu toolbar. The Log window appears. See Figure 17 on page 47.

Note: You must have view log access rights to search and view logs. See “User management” on page 37 for more information.

Figure 17: Log window

1. Logs type	4. Start search
2. Date search	5. Export log. Save selected logs to your computer desktop.
3. Start and end search times	

You can search for recorded logs by the following criteria:

Log type: There are three types of logs: Alarm, Notification and Operation. See Table 5 below for their descriptions.

Date: Logs can be searched by date.

Time: Logs can be searched by start and end recording times.

Table 5: Types of logs

Log type	Description of events included
Alarm	External Alarm In, External Alarm Out, Motion Detect Start, Motion Detect Stop, View Tamper Start, and View Tamper Stop
Notification	Video Signal Loss, Illegal Access, Hard Disk Error, Hard Disk Full, IP Conflict, and DCD Lost
Operation	Power On, Shut Down, Abnormal Shut, Panel Login, Panel Logout, Panel Config, Panel File Play, Panel Time Play, Local Start Record, Local Stop Record, Panel PTZ, Panel Preview, Panel Set Time, Local Upgrade, Net Login, Net Logout, Net Start Record, Net Stop Record, Net Start Transparent Channel, Net Stop Transparent Channel, Net Get Parameter, Net Config, Net get Status, Net Alert On, Net Alert Off, Net Reboot, BiComStart (Start Voice Talk), BiComStop (Stop Voice Talk), Net Upgrade, Net File Play, Net Time Play, Net PTZ

To search logs by type:

1. Click **Log** in the menu toolbar to display the Log window.
2. In the Log Type drop-down list select the desired option.
3. Click **Search** to start your search. The results appear in the window.

To search logs by date and time:

1. Click **Log** in the menu toolbar to display the Log window.
2. Select a date to be searched. Only one day can be searched at a time.
3. Enter a start and end time.
4. Click **Search** to start your search. The results appear in the window.

Archiving recorded files

Export recorded files onto your computer desktop for archiving. You can also archive specific incidents in a file.

Use the standard file player software to play back the videos on your PC.

Video that is manually recorded during live view mode is saved directly to your computer desktop (see page 44).

Note: You must have playback privileges to play back recorded files. Avoid moving the external recording device when backing up information onto it.

To archive a recorded video file:

1. Search for the required recorded file.

For more information on searching for recorded files, see “Playing back recorded video” on page 44 and “Searching event logs” on page 46.

2. Select the file that you want to archive.

3. In playback mode:

Click **Download** to start archiving the file to your computer desktop.

- Or -

While playing back a video, click the save button  to start archiving the file to your computer desktop. Click again to stop archiving.

In log results:

Click the **Export log** to start archiving the file to your computer desktop

To archive a recorded video segment during playback:

1. While playing back a recorded file click the snapshot button  to start recording and click it again to stop recording. A video segment is created.

2. Repeat step 1 to create additional segments. You can generate up to 30 additional segments. The video segments are saved onto your computer desktop.

Controlling zoom and focus

In live view you can control the focus and zoom functions of the camera.

PTZ control panel

Use the PTZ control panel to control the focus and zoom functions of the cameras.

In live view, click  /  to display/hide the PTZ control panel.

Figure 18: PTZ control panel

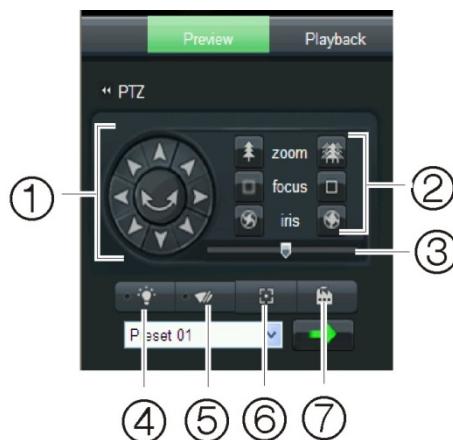

Table 6: Description of the PTZ control panel

Item	Description
1.	Directional pad/auto-scan buttons: Controls the movements and directions of the PTZ. Center button is used to start auto-pan by the PTZ dome camera.
2.	Zoom, focus and iris: Adjusts zoom, focus and iris.
3.	PTZ movement: Adjusts the speed of PTZ movement.
4.	Turns on/off camera light
5.	Turns on/off camera wiper
6.	Auto focus
7.	Initializes the lens

Appendix A

Specifications

TruVision outdoor IP dome cameras

Electrical

Voltage input	24 VAC \pm 10% PoE (IEEE 802.3af - heater will be disabled) High PoE (802.3at)
Power consumption	Max. 12 W (w/o heater) Max. 24 W (heater on)

Miscellaneous

Connectors	AC jack flying lead, RJ45 flying lead
Operating temperature	-40 to +60 °C (-40 to +140 °F)
Storage temperature	-20 to +70 °C (-4 to +158 °F)
Dimensions (D \times H)	Φ 160 \times 146 mm (Φ 6.29 \times 5.75 in.)
Weight	2100 g (4.62 lbs)
Environmental rating	IP66

PC requirements

Intel-based PC	1 GHz or faster
Memory	1 GB RAM
Operating system	Windows® XP, Vista or Windows 7
CGI	Direct X 9.0 or later
Browser	Microsoft Internet Explorer 6.0 or later

TruVision outdoor IP bullet cameras

Electrical

Voltage input	12 VDC, PoE (IEEE 802.3af)
Power consumption	Max. 12 W
Miscellaneous	
Connectors	DC jack flying lead, RJ45 flying lead
Operating temperature	-10 to +60 °C (14 to 140 °F)
Storage temperature	-20 to +70 °C (-4 to +158 °F)
Dimensions (L × W × H)	98 × 88.6 × 328.8 mm (3.86" × 3.49" × 12.94 in.)
Weight	1700 g (3.75 lbs)
Environmental rating	IP66

Network

Protocols	TCP/IP, HTTP, DHCP, DNS, DDNS, RTP/RTCP, PPPoE, SMTP, NTP
Ethernet/IP	CoS 802.1 p/Q, QoS, IPv4

PC requirements

Intel-based PC	1 GHz or faster
Memory	1 GB RAM
Operating system	Windows® XP, Vista or Windows 7
CGI	Direct X 9.0 or later
Browser	Microsoft Internet Explorer 6.0 or later

Appendix B

Pin definitions

There are eight wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight and crossover cable connection:

Figure 19: Straight-through cable

1	White/Orange		White/Orange	1
2	Orange		Orange	2
3	White-Green		White-Green	3
4	Blue		Blue	4
5	White/Blue		White/Blue	5
6	Green		Green	6
7	White/Brown		White/Brown	7
8	Brown		Brown	8

Figure 20: Cross-over cable

1	White/Orange		White/Orange	1
2	Orange		Orange	2
3	White-Green		White-Green	3
4	Blue		Blue	4
5	White/Blue		White/Blue	5
6	Green		Green	6
7	White/Brown		White/Brown	7
8	Brown		Brown	8

Please make sure your connected cables have the same pin assignment and color as above before deploying the cables in your network.
